Spanish Study Hub

A free, school-friendly Spanish practice site with teacher assignments, a gradebook, and weak-spot tracking.

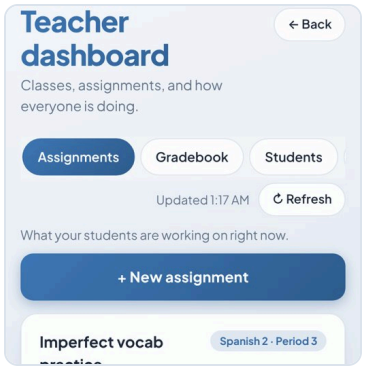

Built by Eva Krasner, 10th grade
spanishwesbitedhs11.netlify.app

WHAT IT IS

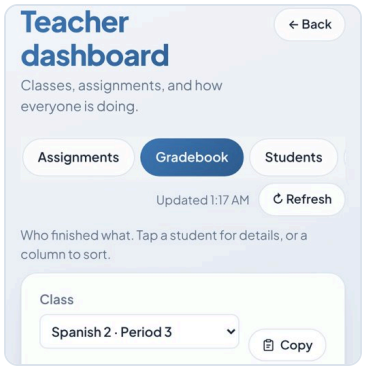

Students practice vocabulary and verb conjugations by typing, with accent buttons and instant feedback. Teachers build units from their own word lists and send assignments to a class. Assignments can be "complete 20 terms at 80%" or "answer 40 words in 8 minutes at 80%." Students turn their work in, and the teacher sees it in a gradebook that copies straight into a spreadsheet. A **Weak spots** page shows which words and verb forms each class misses most and what to reteach. Units can be limited to certain classes, like Standard vs. Honors.

WHY I BUILT IT

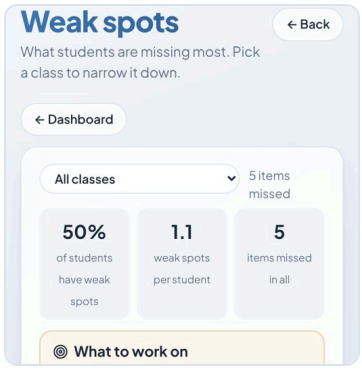

I wanted a different way to study than the tools we were given, because they didn't match how I learn best. In **September** I built a first version to study for one test. Then I turned it into a platform to keep all my study sets in one place. Friends saw me using it and wanted to try it, so I kept improving it and locked editing so only I could change content. In **October** I added the student and teacher side: classes, assignments with goals, turn-in, a gradebook, and weak-spot reports. I wanted to see if it could become something the school could use.

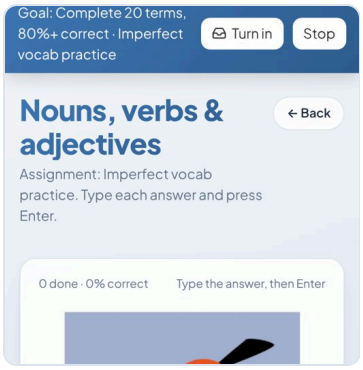

Teacher: assignments and progress

Gradebook (copies to Sheets)

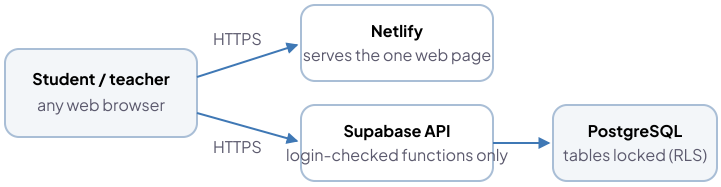

Weak spots: what to reteach

Student: typing an assignment

ARCHITECTURE

The whole app is one static web page. Every read and write goes through server-side functions that check the user's name and PIN (or teacher login) first. The browser never touches the tables directly. Teachers can only see their own classes.

TECH STACK

- **Front end:** one HTML file with plain JavaScript and CSS. No framework, no build step, no packages to keep updated.
- **Hosting:** Netlify (HTTPS), auto-deployed from a private GitHub repo.
- **Database:** Supabase (PostgreSQL) with row-level security and SQL functions. PINs are hashed with bcrypt (pgcrypto).
- **Outside files:** Google Fonts (typeface) and pdf.js from the Cloudflare CDN (reads a PDF a teacher imports). No analytics, ads, or tracking scripts.
- **Testing:** 900+ automated checks, including every built-in verb in all 8 tenses, run before each update.

MAINTENANCE & LONG-TERM SUPPORT

- **Cost:** runs free today on Netlify's and Supabase's free plans. Supabase's free plan normally sleeps after a week of no use, so a scheduled keep-alive service pings it to keep it awake. If the school ever wants extras like automatic daily backups, Supabase offers optional paid plans, but none are needed to run it.
- **Upkeep:** teachers manage all content and classes in the app, with no code needed. Updates go through GitHub, are checked by the automated tests, and go live automatically.
- **Continuity:** the Netlify and Supabase accounts can be moved to a teacher or the district, so the site doesn't depend on me. The code, database scripts, and setup steps are documented in a GitHub repository that can be shared with the school.

STUDENT DATA & SOPPA (ILLINOIS)

Stored	Not collected
Display name (I recommend first name + last initial), a 4-digit PIN stored only as a hash, class membership, practice scores and times, missed words, last-seen time	Email, birthdate, student ID, address, phone, photos, location, device IDs. No ads, no selling or sharing data, no profiles beyond the teacher's reports.

SOPPA requirement (as I understand it)	Status
No targeted ads, selling, or renting of student data	**Met**
Reasonable security for student data	**Met**
Delete student data when the school asks	**Met**
Written data privacy agreement with the district	**Needed**
Breach notice to the school within 30 days; data list posted by the district	**Will commit in the agreement**

Teachers can delete a student, which erases all of that student's results. I'm happy to sign the district's standard agreement (for example, the Illinois Student Data Privacy Agreement). **I'd really appreciate your help checking whether this fits SOPPA, or pointing me to the right person, plus any feedback.**

KNOWN LIMITS

Logins are name + PIN, not school Google sign-in, which could be added later.

ABOUT THE SCREENSHOTS

They show the real "Imperfect verbs and vocab" unit with sample students (Student A, B, C…), not real student data.
